Summary

Petroleum prices rose sharply in the first half of 2008, at one time reaching more than \$140 per barrel of crude oil. Since July, however, petroleum prices and import volumes have fallen at a historically rapid pace; in November, prices of crude oil fell below \$55 per barrel. At the same time the average monthly volume of imports of energy-related petroleum products fell slightly. The sharp rise in the cost of energy imports added an estimated \$50 billion to the nation's trade deficit in 2006 and another \$28 billion in 2007. The fall in the cost of energy imports combined with the drop in import volumes as a result of the slowdown in economic activity has reversed the trend of rising energy imports costs and will sharply reduce the overall costs of U.S. energy imports for the rest of 2008. This report provides an estimate of the initial impact of the rising oil prices on the nation's merchandise trade deficit. This report will be updated as warranted by events.

Background

According to data published by the Census Bureau of the Department of Commerce,¹ the prices of petroleum products over the first half of 2008 rose sharply, generally rising considerably faster than the change in demand for those products, before falling at a historic rate. As a result, the price increases of imported energy-related petroleum products worsened the U.S. trade deficit in 2006 and 2007, and will again in 2008. Energy-related petroleum products is a term used by the Census Bureau that includes crude oil, petroleum preparations, and liquefied propane and butane gas. Crude oil comprises the largest share by far within this broad category of energy-related imports. The slowdown in the rate of growth in the U.S. economy is sharply reducing the amount of energy that the country imports and is helping to push down world energy prices. and, in isolation from other events, is placing upward pressure on the dollar against a broad range of other currencies. To the extent that the additions to the merchandise trade deficit are returned to the U.S. economy as payment for additional U.S. exports or to acquire such assets as securities or U.S. businesses, the U.S. trade deficit could be mitigated further.

Table 1 presents summary data from the Census Bureau for the change in the volume, or quantity, of energy-related petroleum imports and the change in the price, or the value, of those imports for 2007 and for 2008. The data indicate that the United States imported 4.8 billion barrels of total energy-related petroleum products in 2007, valued at \$319 billion. In the January-October period of 2008, the quantity of energy-related petroleum imports fell by 4.3% compared with the comparable period in 2007; crude oil imports also fell by 2.7% from the same period in 2007. Year-over-year, the average value of energy-related petroleum products imports rose by 55.6%, while the average value of crude oil imports rose by 63.6%. As **Figure 1** shows, imports of energy-related petroleum products can vary sharply on a monthly basis, but averaged about 386 million barrels a month in the January-October period of 2008.

Table 1. Summary Data of U.S. Imports of Energy-Related Petroleum Products, Including Oil (not seasonally adjusted)

	January through October					
	2007		2008			
	Quantity (thousands of barrels)	Value (thousands of dollars)	Quantity (thousands of barrels)	Percent change 2007 to 2008	Value (thousands of dollars)	Percent change 2007 to 2008
Total energy- related Petroleum Products	4,035,583	\$254,959,836	3,861,331	-4.3%	\$396,731,537	55.6%
Crude oil	3,092,361	\$188,553,763	3,009,702	-2.7%	\$308,557,422	63.6%

Source: Census Bureau, Department of Commerce. Report FT900, *U.S. International Trade in Goods and Services*, December 11, 2008. Table 17.

Note: Estimates for January through December of 2008 were developed by CRS from data through October 2008 and data through 2007 published by the Census Bureau using a straight line extrapolation.

In value terms, energy-related imports rose from about \$291 billion in 2006 to \$319 in 2007, or an increase of 9.6% to account for about 17% of the value of total U.S. merchandise imports. Data for 2008 indicate that the sharp rise experienced in energy prices in 2007 continued in January through July 2008 and did not follow previous trends of falling during the winter months. As **Figure 2** shows, the cost of U.S. imports of energy-related petroleum products has risen from about \$17 billion per month in early 2007 to \$53 billion a month in July 2008, but fell to \$37 billion in October 2008, reflecting the drop in the price of imported oil. The average price of imported oil in October 2008 was up 27% from the average price in October 2007, but down 26% from the average price in July 2008, reflecting the decrease in the price of imported oil in August through October, as indicated in **Table 2**.

- a. Energy-related petroleum products is a term used by the Census Bureau and includes crude oil, petroleum preparations, and liquefied propane and butane gas.

As a result of the overall rise in the value of energy-related imports in 2007, the trade deficit of such imports rose to \$293 billion to account for 36% of the total \$815 billion U.S. trade deficit, up from one-fifth of the total trade deficit in less than two years. In January-October 2008, the trade deficit in energy-related imports amounted to \$346 billion, or 49% of the total U.S. trade deficit of \$712 billion for the ten-month period.

The quantity of energy imports in 2007 fell by 1.5% below the quantity imported in 2006, but the total price of U.S. energy imports rose by about 10% in 2007 above that for 2006, largely as a result of the continued rise in the prices of imported energy in the October-December period of 2007. In testimony before Congress, Federal Reserve Board Chairman Ben Bernanke indicated that the rise in oil prices, along with other commodity prices, had increased the overall rate of inflation in the economy, such concerns have been eclipsed by the slowdown in the rate of growth in the economy.²

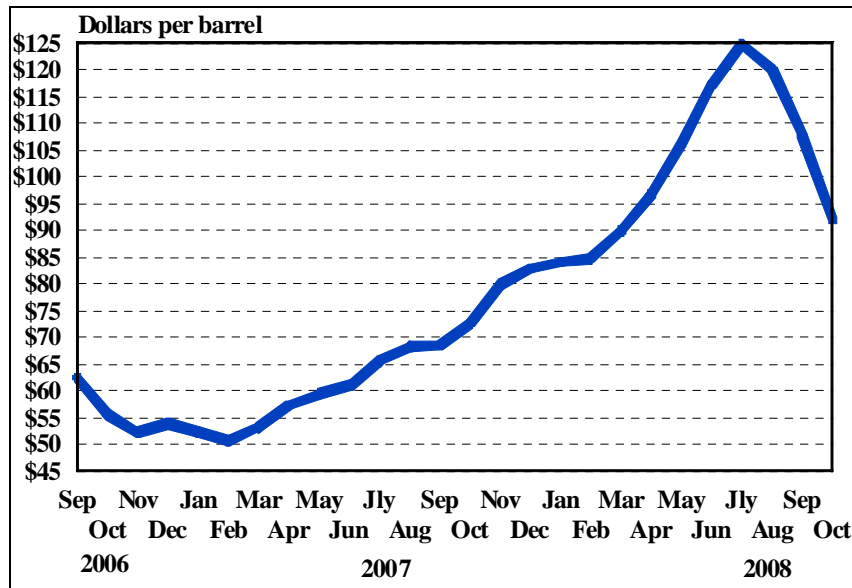

Crude oil comprises the largest share of energy-related petroleum products imports. According to Census Bureau data³ as shown in **Table 2**, imports of crude oil fell from an average of 10.23 million barrels of crude oil imports per day in 2006 to an average of 10.15 million barrels per day in 2007, or a decrease of 1.2%. In December 2007, such imports averaged 9.7 million barrels per day, or an increase of 2.5% over the volume of such imports recorded in December 2006. Data for

² Bernanke, Ben, *The Economy and Financial Markets*, Testimony Before the Banking, Housing, and Urban Affairs Committee, U.S. Senate, February 14, 2008.

³ Report FT900, *U.S. International Trade in Goods and Services*, December 11, 2008. Table 17.

crude oil imports in 2007 indicate that the total quantity of imported oil decreased by 1.2% from the comparable period in 2006. In December 2007, however, despite a 57% rise in the price of crude oil imports year over year, average crude oil imports rose by about 2.5% from December 2006. From June 2007 to June 2008, the average price of crude oil increased from \$61 per barrel to \$117 per barrel for an increase of 92%, as shown in **Figure 3**. As a result, the value of U.S. crude oil imports rose from about \$19 billion a month in June 2007 to \$35 billion a month in June 2008.

Figure 3. U.S. Import Price of Crude Oil

Source: Department of Commerce

Data for the January-October 2008 period indicate that a number of factors combined to push oil prices to record levels in July 2008, before tumbling quickly. The sharp rise in prices combined with a small decrease in the volumes of oil imports experienced combined to post a large jump in the overall cost of imported energy. At times, crude oil traded for nearly \$148 per barrel in July 2008, indicating that the cost of energy imports would have a significant impact on the overall costs of U.S. imports and on the value of the U.S. trade deficit. Since those record prices, the price per barrel of imported crude oil has fallen to nearly \$40 per barrel at times in December 2008. With an expected decrease in the volumes of energy-related petroleum products imports for the remainder of 2008 due to a slowdown in economic activity and at an average price of \$90 per barrel, assuming that imported energy prices remain low in December 2008, energy-related import prices could add about \$90 billion to the trade deficit on an annual basis, pushing the annual trade deficit to nearly \$900 billion.

Issues for Congress

The sharp rise in prices of energy imports experienced since early 2007 is expected to affect the U.S. rate of inflation, likely will have a slightly negative impact on the rate of economic growth in 2008, and pose a number of policy issues for Congress. Various factors are combining to push up the cost of energy imports to record levels at a time when they traditionally have followed a cyclical pattern that has caused energy prices to decline in the winter. A slowdown in the rate of

economic growth in the United States in the spring and summer likely would lessen demand for energy imports and might help restrain the prices of energy imports. An important factor, however, will be the impact Atlantic hurricanes have on the production of crude oil in the Gulf of Mexico. Most immediately, higher prices for energy imports will worsen the nation's merchandise trade deficit, add to inflationary pressures, and have a disproportionate impact on the energy-intensive sectors of the economy and on households on fixed incomes.

Over the long run, a sustained increase in the prices of energy imports will permanently increase the nation's merchandise trade deficit, although some of this impact could be offset if some of the dollars are returned to the U.S. economy through increased purchases of U.S. goods and services or through purchases of such other assets as securities or U.S. businesses. Some of the return in dollars likely will come through sovereign wealth funds (SWFs), or funds controlled and managed by foreign governments, as foreign exchange reserves boost the dollar holdings of such funds. Such investments likely will add to concerns about the national security implications of foreign acquisitions of U.S. firms, especially by foreign governments, and to concerns about the growing share of outstanding U.S. Treasury securities that are owned by foreigners. Over the long-run it is possible for the economy to adjust to the higher prices of energy imports by improving its energy efficiency, finding alternative sources of energy, or searching out additional supplies of energy. There may well be increased pressure applied to Congress to assist in this process. For Congress, the increase in the nation's merchandise trade deficit could add to existing inflationary pressures and complicate efforts to stimulate the economy should the rate of economic growth slow down. In particular, Congress, through its direct role in making economic policy and its oversight role over the Federal Reserve, could face the dilemma of rising inflation, which generally is treated by raising interest rates to tighten credit, and a slowing rate of economic growth, which is usually addressed by lowering interest rates to stimulate investment. A sharp rise in the trade deficit may also add to pressures for Congress to examine the causes of the deficit and to address the underlying factors that are generating that deficit. In addition, the rise in prices of energy imports could add to concerns about the nation's reliance on foreign supplies for energy imports and add impetus to examining the nation's energy strategy.
